## ICPC Southeast USA Regional Contest

## Carryless Square Root

Time limit: 1 second
Carryless addition is the same as normal addition, except any carries are ignored (in base 10). Thus, $37+48$ is 75 , not 85 .

Carryless multiplication is performed using the schoolbook algorithm for multiplication, column by column, but the intermediate sums are calculated using carryless addition. Thus:

$$
\begin{gathered}
9 \cdot 1234=9000+(900+900)+(90+90+90)+(9+9+9+9) \\
=9000+800+70+6=9876
\end{gathered}
$$

$$
90 \cdot 1234=98760
$$

$$
99 \cdot 1234=98760+9876=97536
$$

Formally, define $c_{k}$ to be the $k^{\text {th }}$ digit of the value $c$. If $c=a \cdot b$ then

$$
c_{k}=\left[\sum_{i+j=k} a_{i} \cdot b_{j}\right] \bmod 10
$$

Given an integer $\boldsymbol{n}$, calculate the smallest positive integer $\boldsymbol{a}$ such that $\boldsymbol{a} \cdot \boldsymbol{a}=\boldsymbol{n}$ in carryless multiplication.

## Input

The input consists of a single line with an integer $\boldsymbol{n}\left(1 \leq \boldsymbol{n} \leq 10^{25}\right)$.

## Output

Output the smallest positive integer that is a carryless square root of the input number, or -1 if no such number exists.

| Sample Input | Sample Output |
| :--- | :--- |
| 6 | 4 |
| 149 | 17 |
| 123476544 | 11112 |
| 15 | -1 |
